Capacity

2 Capacity correction

2-1. DVM S

1. Correction coefficient(α) represents the capacity change rate of the system during the maximum load operation in the standard condition. (The correction coefficient(α) value is not much different from that of the standard condition.)
2. When the equivalent length of main pipe is 90m or more between the outdoor unit and the farthest indoor unit, the diameter of the main gas and liquid pipes must be increased by one grade larger. (refer to the 80 page)
3. When the pipe length after the first refrigerant branch kit is 45m or more, the diameter of the gas and liquid pipes between first and final branch kit must be increased by one grade larger. (refer to the 80 page)
4. In this cases, correction coefficient(α) is measured as below based on the overall equivalent length.

→ The overall equivalent length = (Equivalent length of main pipe x correction factor) +
 (Equivalent length of first branch ~ last branch pipe x correction factor) +
 (Equivalent length of last branch ~ farthest indoor unit)

	Correction Factor	
	Standard Size	Size increase
Cooling	1.0	0.5
Heating	1.0	0.2

ex) When the condition is System 8HP.

① Cooling : The overall equivalent length = $80 \times 0.5 + 30 \times 0.5 + 20 = 75(\text{m})$
 cooling correction coefficient(α) = 0.91

② Heating : The overall equivalent length = $80 \times 0.2 + 30 \times 0.2 + 20 = 42(\text{m})$
 heating correction coefficient(α) = 0.99

5. The correction coefficient(α) can be reduced according to the condition of pipe insulation.

Heat Pump

1) 8HP
